

Kubernetes - (Killercode)

Deployment rolling commands:

To run deployment rolling commands, initially we need the following things to exist and to implement them.

- Check for namespace; default namespaces will be there.
- Create a namespace
- Now we need “deployment.yaml” file.
- Create yaml file and run that.

Below are the essentials to run rolling commands:

The screenshot shows the Killercode Kubernetes playground interface. On the left, there's a sidebar with the title "Kubernetes 1.34" and some introductory text. A "START" button is visible. The main area is a terminal window showing the following commands and outputs:

```
controlplane:~$ kubectl get ns -A
NAME                STATUS    ROLES    AGE    VERSION
controlplane        Ready    control-plane  19d    v1.34.3
node01              Ready    <none>      19d    v1.34.3
controlplane:~$ kubectl create ns amazon-ns
namespace/amazon-ns created
controlplane:~$ kubectl get ns -A
NAME                STATUS    AGE
amazon-ns           Active    3s
default             Active    19d
kube-node-lease     Active    19d
kube-public         Active    19d
kube-system         Active    19d
local-path-storage  Active    19d
controlplane:~$ ls
filesystem
controlplane:~$ mkdir k8s-yaml
controlplane:~$ cd k8s-yaml/
controlplane:~/k8s-yaml$ kubectl get deployments -n amazon-ns
No resources found in amazon-ns namespace.
controlplane:~/k8s-yaml$ vi deployment.yaml
controlplane:~/k8s-yaml$ kubectl apply -f deployment.yaml
deployment.apps/nginx-deployment created
controlplane:~/k8s-yaml$
```

Now to inspect the deployment, use describe command:

Kubernetes 1.34

This playground will always have the latest Kubeadm Kubernetes version a few weeks after release.

You have access to an empty Kubeadm cluster with two 2GB nodes. The controlplane node has taint removed to be able to schedule workload as well.

There are also more [K8s Playgrounds](#) like [One-Node-4GB](#) available.

START

```
local-path-storage Active 19d
controlplane:~$ ls
filesystem
controlplane:~$ mkdir k8s-yaml
controlplane:~$ cd k8s-yaml/
controlplane:~/k8s-yaml$ kubectl get deployments -n amazon-ns
No resources found in amazon-ns namespace.
controlplane:~/k8s-yaml$ vi deployment.yaml
controlplane:~/k8s-yaml$ kubectl apply -f deployment.yaml
deployment.apps/nginx-deployment created
controlplane:~/k8s-yaml$ kubectl describe deployment nginx-deployment -n amazon-ns
Name: nginx-deployment
Namespace: amazon-ns
CreationTimestamp: Fri, 20 Feb 2026 02:51:28 +0000
Labels: <none>
Annotations: deployment.kubernetes.io/revision: 1
Selector: app=nginx
Replicas: 6 desired | 6 updated | 6 total | 6 available | 0 unavailable
StrategyType: RollingUpdate
MinReadySeconds: 0
RollingUpdateStrategy: 25% max unavailable, 25% max surge
Pod Template:
  Labels: app=nginx
  Containers:
    deployment-container:
      Image: nginx:latest
      Port: 8081/TCP
      Host Port: 0/TCP
      Environment: <none>
      Mounts: <none>
```

Check all things under the namespace:

Kubernetes 1.34

This playground will always have the latest Kubeadm Kubernetes version a few weeks after release.

You have access to an empty Kubeadm cluster with two 2GB nodes. The controlplane node has taint removed to be able to schedule workload as well.

There are also more [K8s Playgrounds](#) like [One-Node-4GB](#) available.

START

```
Volumes: <none>
Node-Selectors: <none>
Tolerations: <none>
Conditions:
  Type           Status Reason
  ----           -
  Available      True   MinimumReplicasAvailable
  Progressing    True   NewReplicaSetAvailable
OldReplicaSets: <none>
NewReplicaSet: nginx-deployment-868f54cccd (6/6 replicas created)
Events:
  Type Reason Age From Message
  ---- -
  Normal ScalingReplicaSet 9m11s deployment-controller Scaled up replica set nginx-deployment-868f54cccd from 0 to 6
controlplane:~/k8s-yaml$ kubectl get all -n amazon-ns
NAME READY STATUS RESTARTS AGE
pod/nginx-deployment-868f54cccd-9g4lf 1/1 Running 0 9m28s
pod/nginx-deployment-868f54cccd-9g8gw 1/1 Running 0 9m28s
pod/nginx-deployment-868f54cccd-bnfrj 1/1 Running 0 9m28s
pod/nginx-deployment-868f54cccd-cqz8n 1/1 Running 0 9m28s
pod/nginx-deployment-868f54cccd-qq2vm 1/1 Running 0 9m28s
pod/nginx-deployment-868f54cccd-w2wbq 1/1 Running 0 9m28s
NAME READY UP-TO-DATE AVAILABLE AGE
deployment.apps/nginx-deployment 6/6 6 6 9m28s
NAME DESIRED CURRENT READY AGE
replicaset.apps/nginx-deployment-868f54cccd 6 6 6 9m28s
controlplane:~/k8s-yaml$
```

Now check the pod allotted by the namespace using deployment:

Kubernetes 1.34

This playground will always have the latest Kubeadm Kubernetes version a few weeks after release.

You have access to an empty Kubeadm cluster with two 2GB nodes. The controlplane node has taint removed to be able to schedule workload as well.

There are also more [K8s Playgrounds](#) like *One-Node-4GB* available.

START

Editor Tab 1

```

controlplane:~/k8s-yaml$ kubectl rollout undo deployment nginx-deployment -n amazon-ns
error: no rollout history found for deployment "nginx-deployment"
controlplane:~/k8s-yaml$

```

Initially there is no rollout undo command.

Check the rollout history command:

Kubernetes 1.34

This playground will always have the latest Kubeadm Kubernetes version a few weeks after release.

You have access to an empty Kubeadm cluster with two 2GB nodes. The controlplane node has taint removed to be able to schedule workload as well.

There are also more [K8s Playgrounds](#) like [One-Node-4GB](#) available.

START

Warning FailedMount 11m kubelet MountVolume.SetUp failed for volume "kube-api-access-mb9lt" : failed to fetch token: Post "https://172.30.1.2:6443/api/v1/namespaces/amazon-ns/serviceaccounts/default/token": http2: client connection lost

Normal Pulling 11m kubelet Pulling image "nginx:latest"

Normal Pulled 11m kubelet Successfully pulled image "nginx:latest" in 294ms (294ms including wait time). Image size: 62939286 bytes.

Normal Created 11m kubelet Created container: deployment-container

Normal Started 11m kubelet Started container deployment-container

controlplane:~/k8s-yaml\$ kubectl get all -n amazon-ns

NAME	READY	STATUS	RESTARTS	AGE
